Graphic Concrete™ offers a new way to produce a patterned concrete surface. The patented Graphic Concrete™ technology involves applying a surface retarder to the surface of a special membrane. This method allows precast concrete manufacturers to produce high-quality concrete elements and slabs. The end result is a patterned, smooth or completely exposed surface. The pattern on the surface results from the contrast between the fairface and the exposed fine aggregate finish. This is a cost-effective, tested and safe method because traditional exposed fine aggregate materials and processes are used in the manufacturing of concrete elements.

Graphic Concrete™ offers developers, designers and the concrete industry completely new opportunities.

More freedom and options for designers

Graphic Concrete™ allows you to use concrete in new and stylish ways; add the desired pattern to a concrete surface by using our collection or developing your own unique design. The surface can also be even, in which case the options are smooth and velvety or a completely exposed fine aggregate finish.

Graphic Concrete™

- Ideal for façades, partition walls, walls and garden slabs
- Suitable for concrete elements and slabs of all sizes
- Easy and versatile to use
- Durable, genuine concrete
- A stylish and reasonably-priced solution

More detailed information about the design of Graphic Concrete™ and the opportunities it offers is available in the designer instructions on our website at or direct from Graphic Concrete™.

Cost effectiveness and safety for the construction industry

We develop and offer solutions that allow the precast concrete industry to produce stylish new concrete surfaces cost effectively and safely.

As a high-quality solution that meets a specific demand, Graphic Concrete™ increases consumption of concrete elements and other concrete products. The production process for the elements is similar to that used to produce traditional exposed fine aggregate finishes. Use of the Graphic Concrete™ method allows element plants the chance to diversify their range of products, increase production efficiency and shorten lead times. Our products also mean improved occupational safety and comfort at the plant because the retarder is delivered in dry form; plant personnel don't need to use mould oil, handle solvents or clean the moulds to remove the retarder.

Graphic Concrete™

- Creates the opportunity to increase demand for concrete elements
- Makes it possible to create unique patterned concrete surfaces and high-quality fairface and exposed aggregate finishes
- A cost-effective and safe solution

We train plants in the use of Graphic Concrete™ products and technology.

Durability and reasonable pricing for developers

Graphic Concrete™ offers the chance to produce a stylish façade at a reasonable price. Numerous precast concrete manufacturers use Graphic Concrete™ technology and we already have dozens of references.

Graphic Concrete™ is

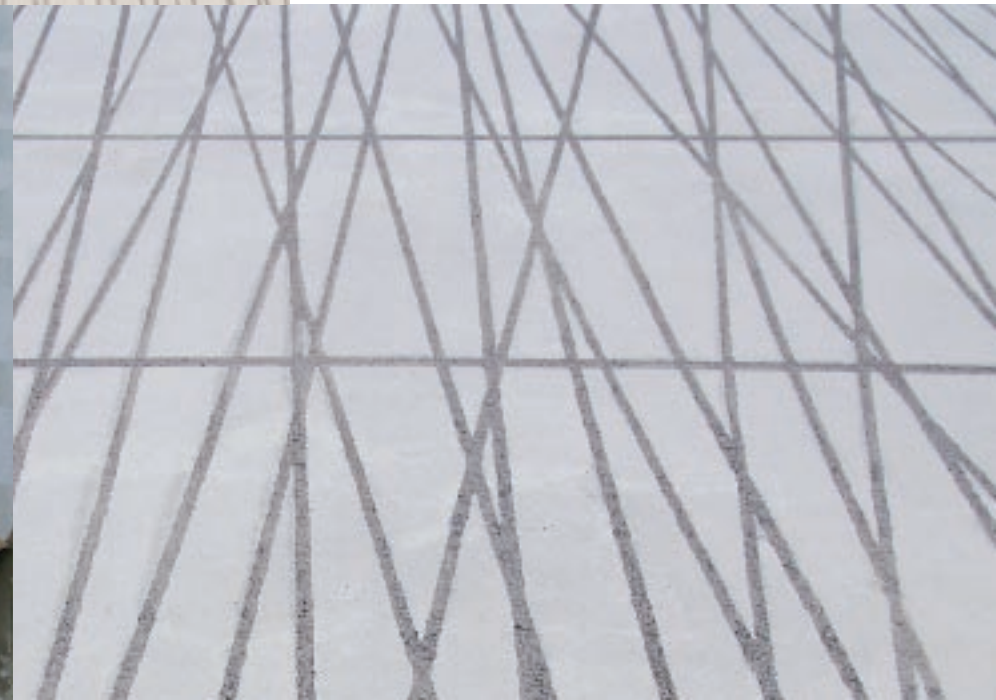

- Stylish and reasonably priced
- Durable and easy to maintain
- Tested and safe

We would be pleased to tell you more about the benefits Graphic Concrete™ has to offer developers.
